

Classifying Drug Dataset

Overview

This dataset is designed for the classification of drugs based on various patient attributes and health metrics. It aims to facilitate the development of predictive models that can assist in determining the appropriate drug for patients.

Dataset Description

Features:

Includes attributes such as age, sex, blood pressure, cholesterol levels, and sodium to potassium ratio.

Target Variable:

The type of drug prescribed.

Purpose

The dataset is intended for use in machine learning projects, allowing users to explore classification algorithms and improve drug prescription accuracy based on patient data.
